

IceWarp

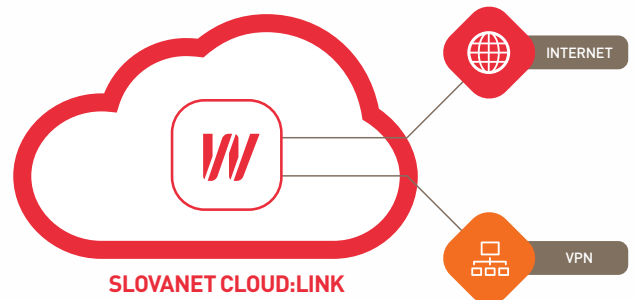

Telecommunication services for your business

- cost-effective communications solution
- simplicity, security, flexibility
- modern HTML5 user interface

Cloud application bundle for email and communications

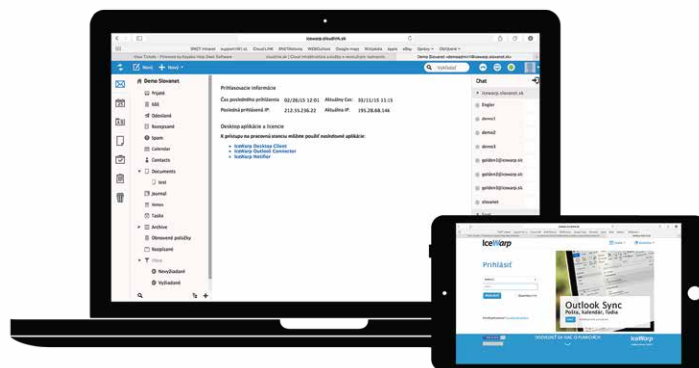

The **iceWarp** solution is an advanced bundle of applications including a cloud **e-mail server**, **services for sharing contacts and documents**, **planning meetings**, **synchronising mobile devices** and **proactive security**. iceWarp is a fully functional and variable cloud communications solution for companies and organisations of all sizes.

Your **iceWarp** mail server provides full control, monitoring and automatic 3-day backup of all your data. Simply select the disk capacity you need and we'll efficiently allocate resources to meet your needs. Mail server performance is simple to configure to meet your current needs, from rapid expansion to high load periods.

Service benefits

- simplicity, security, flexibility
- high reliability and availability
- secure communications using 256-bit AES encryption
- modern HTML5 user interface
- integrated spam and anti-virus protection
- intelligent attack detection system
- cost-effective solution

IceWarp

Telecommunication services for your business

Email, archiving and administration

The efficient and reliable mail server provides convenient user administration, supports multiple domains and integration with an Active Directory controller, including single sign-on (SSO). It has a smart de-duplication feature for attachments and advanced user properties. It archives received and sent emails in real time and supports data restoration at the individual user level.

Web, desktop and Outlook

You'll find the **iceWarp** client web interface appears much the same as a normal desktop application. Your emails, calendars and documents are always there whenever you need them. This full-function alternative to an email client on a workstation uses a full connection to the server. Simple expansion permits full integration with the beloved MS Outlook email client in its 2007, 2010 and 2013

Instant messaging, voice and video

Communicate securely and online inside your company using the private IM service via the web interface or your favourite IM client. The system also supports voice communications and the ability to organise a video conference directly in the web interface. The server may be connected to the local private branch exchange (PBX).

Agenda, sharing and documents

The **iceWarp** user interface has planning features for day-to-day scheduling, meetings and the use of resources, private and corporate contacts and a task planning tool with progress monitoring. Share anything with colleagues or entire work groups with a single click. Make emails, calendars and documents available in a matter of moments and open your documents directly in Word and Excel with modifications saved directly on the server.

Spam and virus protection

Spam protection is resolved with more than 20 filters and smart technology from Commtouch. Eset supplies the anti-virus protection for our software and it verifies everything, from emails and documents to communications.

Mobile office

Complete support for MS Exchange ActiveSync facilitates the synchronisation of user data with mobile phones across all platforms.

Broad system and database support

iceWarp supports the following operating systems: MS Windows Server 2003 and higher, RedHat Enterprise, CentOS, Debian and Ubuntu. Connecting to MySQL, MSSQL and Oracle databases is also simple.

Filters, archiving and retention policy

Configurable rules and filters are available at the server, domain, group and user levels for mail processing. Thanks to automatic mail archiving, users can easily restore individual emails by pulling them out of the archive folder with the mouse. The integrated archiving solution supports automatic deletion of emails over a set number of years old while individual emails can remain accessible even after deletion.

Monitoring operations and statistics in real time

The **iceWarp** application administrator may monitor the connection to the mail server, web and connected mobile devices in real time. Statistics streamline system administration and are available to monitor parameters including the number of received and sent emails, the activity of the integrated spam and anti-virus protection and other services.
