

ethernet:LINK

Telecommunication services for your business

- a less expensive and more flexible alternative to expensive digital circuits
- competitively priced, efficient and flexible conditions
- simple network integration solution for local, national and multi-national companies

Professional solution for the best

ethernet:LINK enables connections to be made between your ethernet networks at the 2nd layer of the ISO OSI model. Such connection facilitates the operation of more demanding applications including data centres and video solutions and provides transparent connections between branches without any need to resolve IP routing. **ethernet:LINK** provides the circuits you need with major operating cost savings.

All of this can be implemented in local infrastructure or within national and multi-national solutions where customers may need flexible ethernet interfaces comparable to a circuit-based solution instead of more traditional IP VPN networks. The **ethernet:LINK** service is not based on IP routing as opposed to the **vpn:LINK** service.

ethernet:LINK provides you with the following advantages

- a less expensive alternative to rented circuits (SDH) with lower costs
- flexible capacity with the most commonly used interfaces
- Point-to-Point or Point-to-Multipoint topology
- transparent solutions
- standardized ethernet technology
- a wide range of last-mile technology
- guaranteed SLA
- 24/7 customer service
