security:LINK

✓ video monitoring in the cloud

✓ modern and secure turnkey solution

✓ watch recordings online or using a mobile application

Security under control from anywhere

security:LINK is a VSaaS (Video Surveillance as a Service) cloud-based security solution. This service includes video monitoring, storage of recordings, remote playback and camera management. No additional software is needed because video processing and recording management takes place directly in the cloud environment. Video recordings and archives are accessible anywhere using a computer, smartphone, tablet or mobile application.

Video analysis

The video analysis module is an advanced extension that improves the performance of automatic surveillance over critical incidents, including detection of missing object, classification and counting of objects, detection of new objects, automatic surveillance of a moving object, detection of stopped vehicles and reading of vehicle registration plates.

Advantages of the service

- camera system as a service (administration and service calls included in the price)
- advantageous pricing conditions
- comprehensive turnkey solution
- professional-grade IP cameras
- 24/7 monitoring of camera functionality
- e-mail or SMS outage notification
- remote access to live feed and archive online or using a mobile application

How does it work?

The **security:LINK** service is a combination of the best that traditional IP camera systems offer and modern innovations of the present day. Video recordings are stored online in a TIER III-classified secure data centre. The recordings are then converted into an appropriate format for viewing using a computer, smartphone or tablet. Camera recordings are accessible to users anywhere with Internet access, which significantly increases convenience and the security of monitored buildings.
